

# END OF CHAPTER EXERCISES

## Chapter 16 : Spot FX : Fundamentals And Noise Traders

### Investments : Spot and Derivatives Markets

(Keith Cuthbertson, Dirk Nitzsche)

1. Why might a rapid growth in the domestic money supply lead to a depreciating exchange rate? Do you know of any instances where this has occurred?
2. If exchange rates are fixed, then what determines the rate of price inflation in a small open economy?
3. Why might the economy take a long time to achieve PPP ?
4. Suppose that the 1-year spot interest rate in Euroland is  $r = 8\%$  and in USA is  $r^* = 5\%$  and (rather stupidly) FOREX dealers (who are risk neutral) expect the Euro-USD exchange rate over the next year to remain unchanged ?
  - (a) What will happen to the spot exchange rate, today and why?
  - (b) At what point will the spot exchange rate stop rising or falling? (i.e. equilibrium is restored on the capital account)
  - (c) What are the likely consequences for UK exports and imports in the short-term and in the longer term ?
5. In practice what do you think determines 'short run' and 'long run' changes in the exchange rate?
6. Do monetary models of the exchange rate explain past movements in spot FX-rates ?
7. What are the principal mechanisms that produce exchange rate overshooting ?
