æ

We continue to look at the problem of finding roots of systems of equations:

$$\mathbf{x} = (x_1, x_2, \dots, x_N) \quad \mathbf{f}(\mathbf{x}) = (f_1(\mathbf{x}), f_2(\mathbf{x}), \dots, f_N(\mathbf{x}))$$

Or more briefly:

$$f(x) = 0$$

Today we focus on nonlinear problems such as finding the roots of:

$$f_1(x_1, x_2) = 2 - x_1^2 - x_2 = 0$$
 and $f_2(x_1, x_2) = 2x_1 - x_2^2 - 1 = 0.$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

How do we set about this?

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Root Finding

Roots of systems of equations Non-linear simultaneous equations Partial differentiation Newton's method in two variables

Non-linear simultaneous equations

We will look for a solution of the simultaneous equations

$$f(x,y) = 0$$
 and $g(x,y) = 0$

We will develop the method for two equations in two unknowns, but it will becomes clear how the method can be extended to n equations in n unknowns.

(4月) (4日) (4日)

Note we introduce a third variable

$$z = f(x, y) = 0$$
 and $z = g(x, y) = 0$

This will help us understand what is going on very much as we did for Newton's method:

If we plot
$$z = f(x, y)$$
 and $z = g(x, y)$ we get two surfaces:

$$z = g(x, y)$$

$$z = f(x, y)$$

$$y$$

$$z = f(x, y)$$

$$y$$

$$z = f(x, y)$$

$$y$$

Since we require z = 0 we look to see where these two surfaces intersect on the *x*-*y* plane.

・ロン ・回 と ・ヨン ・ヨン

The surfaces will intersect on the x-y plane in two curves, C_1 and C_2 . We are looking for the intersections of these two curves, this will be at the point *P*.

Our initial guess at x and y will, in general, not be on either C_1 or C_2 .

イロト イヨト イヨト イヨト

Previously for Newton's method we used a *tangent* to the curve to estimate where it crossed the *x*-axis.

Here we will use a *tangent surface* to estimate where the surface crosses the x-y plane.

イロト イヨト イヨト イヨト

Root Finding Partial differentiation Newton's method in two variables

We start with a point (x_0, y_0) and construct the line which is a tangent to the surface in the plane $y = y_0$. In this plane y is constant

If z = f(x) the tangent line through $x = x_0$ and $z = f(x_0)$ is given by

$$z = f(x_0) + (x - x_0)f'(x_0)$$

If z = f(z) the tangent line through $x = x_0$ and $z = f(x_0, y_0)$ in the plane $y = y_0$ is given by

$$z = f(x_0, y_0) + (x - x_0)f_x(x_0, y_0), \qquad y = y_0$$

where $f_x(x_0, y_0)$ is the derivative of f(x, y) with respect x keeping y constant. This is called **partial differentiation**.

・ロン ・回 と ・ ヨ と ・ ヨ と

Root Finding

Roots of systems of equations Non-linear simultaneous equations **Partial differentiation** Newton's method in two variables

Partial differentiation

To find the **partial derivative of** f(x, y) with respect to x we do normal differentiation but treating y as a constant. The derivative is written as

$$f_x(x,y)$$
 or $\frac{\partial f}{\partial x}$

Example: If $f(x, y) = 2 - x^2y + 4x + 5y$, find $f_x(x, y)$.

イロト イポト イヨト イヨト

Root Finding

Roots of systems of equations Non-linear simultaneous equations **Partial differentiation** Newton's method in two variables

Partial differentiation

To find the **partial derivative of** f(x, y) with respect to x we do normal differentiation but treating y as a constant. The derivative is written as

$$f_x(x,y)$$
 or $\frac{\partial f}{\partial x}$

Example: If $f(x, y) = 2 - x^2y + 4x + 5y$, find $f_x(x, y)$.

$$f_x(x,y) = -2xy + 4$$

イロト イポト イヨト イヨト

In a similar way we can find the **partial derivative of** f(x, y) with **respect to** y. We do normal differentiation with y as our independent variable, but treating x as a constant. The derivative is written as

$$f_y(x,y)$$
 or $\frac{\partial f}{\partial y}$

Example: If $f(x, y) = 2 - x^2y + 4x + 5y$, find $f_y(x, y)$.

In a similar way we can find the **partial derivative of** f(x, y) with **respect to** y. We do normal differentiation with y as our independent variable, but treating x as a constant. The derivative is written as

$$f_y(x,y)$$
 or $\frac{\partial f}{\partial y}$

Example: If $f(x, y) = 2 - x^2y + 4x + 5y$, find $f_y(x, y)$.

$$f_y(x,y) = -x^2 + 5$$

The tangent line through $x = x_0$, $y = y_0$ and $z = f(x_0, y_0)$ in the plane $y = y_0$ is given by

$$z = f(x_0, y_0) + (x - x_0)f_x(x_0, y_0), \qquad y = y_0$$

The tangent line through $x = x_0$, $y = y_0$ and $z = f(x_0, y_0)$ in the plane $x = y_0$ is given by

$$z = f(x_0, y_0) + (y - y_0)f_y(x_0, y_0), \qquad x = x_0$$

We have the two tangent lines

$$z = f(x_0, y_0) + (x - x_0)f_x(x_0, y_0), \qquad y = y_0$$

$$z = f(x_0, y_0) + (y - y_0)f_y(x_0, y_0), \qquad x = x_0$$

The tangent plane passes through $x = x_0$, $y = y_0$ and $z = f(x_0, y_0)$ and will include these two lines. This plane is given by

$$z = f(x_0, y_0) + (x - x_0)f_x(x_0, y_0) + (y - y_0)f_y(x_0, y_0).$$

イロン イヨン イヨン イヨン

The tangent plane will cut the x-y plane along the line L_1 given by

$$0 = f(x_0, y_0) + (x - x_0)f_x(x_0, y_0) + (y - y_0)f_y(x_0, y_0).$$

We will use this as an approximation to the curve C_1 .

・ロト ・日本 ・モート ・モート

When x_0 and y_0 are close to C_1 we expect L_1 to be a good local approximation to C_1 .

Similarly, if C_2 is the line in the x-y plane given by g(x, y) = 0 we expect to be able to approximate this by the line L_2 , which is given by

$$0 = g(x_0, y_0) + (x - x_0)g_x(x_0, y_0) + (y - y_0)g_y(x_0, y_0).$$

We want to find where L_1 and L_2 cross to get our next guess at the root.

・ロン ・回と ・ヨン ・ヨン

Root Finding

Roots of systems of equations Non-linear simultaneous equations Partial differentiation Newton's method in two variables

Newton's method in two variables

To Find where L_1 and L_2 cross we proceed as follows:

We need to solve

$$0 = f(x_0, y_0) + (x - x_0)f_x(x_0, y_0) + (y - y_0)f_y(x_0, y_0)$$

$$0 = g(x_0, y_0) + (x - x_0)g_x(x_0, y_0) + (y - y_0)g_y(x_0, y_0)$$

Write in matrix notation:

$$\left(\begin{array}{c}0\\0\end{array}\right) = \left(\begin{array}{c}f\\g\end{array}\right)_{(x_0,y_0)} + \left(\begin{array}{c}f_x&f_y\\g_x&g_y\end{array}\right)_{(x_0,y_0)} \left(\begin{array}{c}x_1-x_0\\y_1-y_0\end{array}\right)$$

Notation: we have placed (x_0, y_0) outside the brackets to indicates that the functions inside the brackets are evaluated at (x_0, y_0) .

イロン イヨン イヨン イヨン

Rearrange:

$$-\begin{pmatrix} f\\g \end{pmatrix}_{(x_0,y_0)} = \begin{pmatrix} f_x & f_y\\g_x & g_y \end{pmatrix}_{(x_0,y_0)} \begin{pmatrix} x_1 - x_0\\y_1 - y_0 \end{pmatrix}$$

Use the inverse of the matrix:

$$-\left(\begin{array}{cc}f_{x} & f_{y}\\g_{x} & g_{y}\end{array}\right)^{-1}_{(x_{0},y_{0})}\left(\begin{array}{c}f\\g\end{array}\right)_{(x_{0},y_{0})}=\left(\begin{array}{c}x_{1}-x_{0}\\y_{1}-y_{0}\end{array}\right)$$

Split the vector on the right:

$$-\begin{pmatrix} f_{x} & f_{y} \\ g_{x} & g_{y} \end{pmatrix}_{(x_{0},y_{0})}^{-1} \begin{pmatrix} f \\ g \end{pmatrix}_{(x_{0},y_{0})} = \begin{pmatrix} x_{1} \\ y_{1} \end{pmatrix} - \begin{pmatrix} x_{0} \\ y_{0} \end{pmatrix}$$

Rearrange:

$$\left(\begin{array}{c} x_1\\ y_1\end{array}\right) = \left(\begin{array}{c} x_0\\ y_0\end{array}\right) - \left(\begin{array}{c} f_x & f_y\\ g_x & g_y\end{array}\right)^{-1} \left(\begin{array}{c} f\\ g\end{array}\right)_{(x_0,y_0)} \left(\begin{array}{c} f\\ g\end{array}\right)_{(x_0,y_0)}$$

æ

We expect (hope?) that $x = x_1$ and $y = y_1$ will be a better approximation to the root of f(x, y) = g(x, y) = 0.

We use the iterative scheme

$$\begin{pmatrix} x_n \\ y_n \end{pmatrix} = \begin{pmatrix} x_{n-1} \\ y_{n-1} \end{pmatrix} - \begin{pmatrix} f_x & f_y \\ g_x & g_y \end{pmatrix}_{(x_{n-1},y_{n-1})}^{-1} \begin{pmatrix} f \\ g \end{pmatrix}_{(x_{n-1},y_{n-1})} n = 1, 2...$$

starting with some point (x_0, y_0) close to a solution.

イロト イポト イヨト イヨト

We expect (hope?) that $x = x_1$ and $y = y_1$ will be a better approximation to the root of f(x, y) = g(x, y) = 0.

We use the iterative scheme

$$\begin{pmatrix} x_n \\ y_n \end{pmatrix} = \begin{pmatrix} x_{n-1} \\ y_{n-1} \end{pmatrix} - \begin{pmatrix} f_x & f_y \\ g_x & g_y \end{pmatrix}_{(x_{n-1},y_{n-1})}^{-1} \begin{pmatrix} f \\ g \end{pmatrix}_{(x_{n-1},y_{n-1})} n = 1, 2...$$

starting with some point (x_0, y_0) close to a solution.

Note equivalence to Newton's method in one variable:

$$x_n = x_{n-1} - (f'(x_{n-1}))^{-1}f(x_{n-1}) = x_{n-1} - \frac{f(x_{n-1})}{f'(x_{n-1})}$$

イロト イポト イヨト イヨト

The extension to N equations in N unknowns is reasonably obvious. The matrix of partial derivatives will be $N \times N$ and the column vectors will have N entries.

For example, for N = 3, to solve f(x, y, z) = g(x, y, z) = h(x, y, z) = 0 near the point (x_0, y_0, z_0) the scheme becomes:

$$\begin{pmatrix} x_n \\ y_n \\ z_n \end{pmatrix} = \begin{pmatrix} x_{n-1} \\ y_{n-1} \\ z_{n-1} \end{pmatrix} - \begin{pmatrix} f_x & f_y & f_z \\ g_x & g_y & g_z \\ h_x & h_y & h_z \end{pmatrix}^{-1} \begin{pmatrix} f \\ g \\ h \end{pmatrix} \quad n = 1, 2 \dots$$

where the functions and derivatives on the right-hand side of the equation are evaluated at $(x_{n-1}, y_{n-1}, z_{n-1})$.

Roots of systems of equations Non-linear simultaneous equations Partial differentiation Newton's method in two variables

Example: Using recent notation, we want to find the root of

$$f(x,y) = 2 - x^2 - y = 0$$
 and $g(x,y) = 2x - y^2 - 1 = 0$.

We want to obtain the solution close to the point x = 0.5, y = 0.5 (not a particularly good guess).

イロト イポト イヨト イヨト

To calculate the matrix we have to obtain four partial derivatives:

Thus the first step of the scheme is given by:

$$\begin{pmatrix} x_1 \\ y_1 \end{pmatrix} = \begin{pmatrix} x_0 \\ y_0 \end{pmatrix} - \begin{pmatrix} f_x & f_y \\ g_x & g_y \end{pmatrix}^{-1} \begin{pmatrix} f \\ g \end{pmatrix}_{(x_0, y_0)}$$
$$\Rightarrow \quad \begin{pmatrix} x_1 \\ y_1 \end{pmatrix} = \begin{pmatrix} x_0 \\ y_0 \end{pmatrix} - \begin{pmatrix} -2x_0 & -1 \\ 2 & -2y_0 \end{pmatrix}^{-1} \begin{pmatrix} 2 - x_0^2 - y_0 \\ 2x_0 - y_0^2 - 1 \end{pmatrix}$$

イロン イヨン イヨン イヨン

Substituting in our initial guess $x_0 = 0.5$ and $y_0 = 0, 5$:

$$\begin{pmatrix} x_1 \\ y_1 \end{pmatrix} = \begin{pmatrix} 0.5 \\ 0.5 \end{pmatrix} - \begin{pmatrix} -1 & -1 \\ 2 & -1 \end{pmatrix}^{-1} \begin{pmatrix} 1.25 \\ -0.25 \end{pmatrix}$$
$$= \begin{pmatrix} 0.5 \\ 0.5 \end{pmatrix} - \begin{pmatrix} -1/3 & 1/3 \\ -2/3 & -1/3 \end{pmatrix} \begin{pmatrix} 1.25 \\ -0.25 \end{pmatrix}$$
$$= \begin{pmatrix} 0.5 \\ 0.5 \end{pmatrix} - \begin{pmatrix} -1/2 \\ -3/4 \end{pmatrix} = \begin{pmatrix} 1 \\ 1.25 \end{pmatrix}$$

・ロト ・回ト ・ヨト ・ヨト

æ

Continuing this scheme to iterate gives the following results:

We see that the scheme converges rapidly to the root x = 1, y = 1. (You can check this is indeed the root.)
