

Balanced Walking?

Balanced Walking!

Recommended for patients who have lower limb damage like sprain, fracture and prosthesis or stroke which effects one side of the patient's body and is shown as unsymmetrical walk.

The equal loading and the regular trundling are the most important things for healthy joints (ankle, knee, hip and spine) and muscles.

By monitoring the patient's unbalanced walking, and providing the patient with immediate feedback on what is wrong and how to improve the walking, the device helps patients in their rehabilitation process.

The doctor can follow the rehabilitation process through a website and provide stimulating comments. This implies a better guidance for the patient during the rehabilitation process.
