Plan for today

- Design Process
- Customer requirements
 - » Objectives tree method
- Team meeting
- Project assignment
 - » Tennis ball server

Ahmed Kovacevic, City University London

The Engineering Design Process

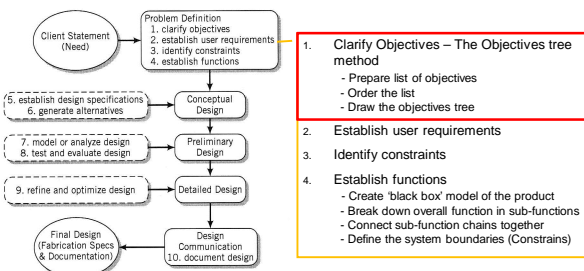

Requirements

- Engineering Design Process 2nd Edition, Chapter 4
 - » Expand requirements from the needs statement
 - » Prioritize requirements according to importance
 - » Organize requirements into an objective tree

Ahmed Kovacevic, City University London

Phase 1: Clarify Problem

Why Design is Important?

- Without Design, there is no product!
- With a poor design, no matter how good the manufacturing methods are, or quality control, etc, the end product will still be a bad idea and no one will buy
- Most people will buy something based on the design followed by the quality
- What about cost?

Ahmed Kovacevic, City University London

Why Design is Important?

- Most end-users do not know/care about the details or technical features of a product.
- They look only at the design ... both the functionality of the product and the way it looks.
- Think about how people choose to buy a kettle or even a mobile phone.

Identifying your Customers

- Everyone has a different opinion / desire on how a product should be designed...
- Customers of a product are NOT just the end-users.
- Who do you think are customers of an airplane?
- Customers include the people that manufacture, maintain, sell, disassemble... etc.

How an airplane should be designed..

According to:

How an airplane should be designed..

According to:

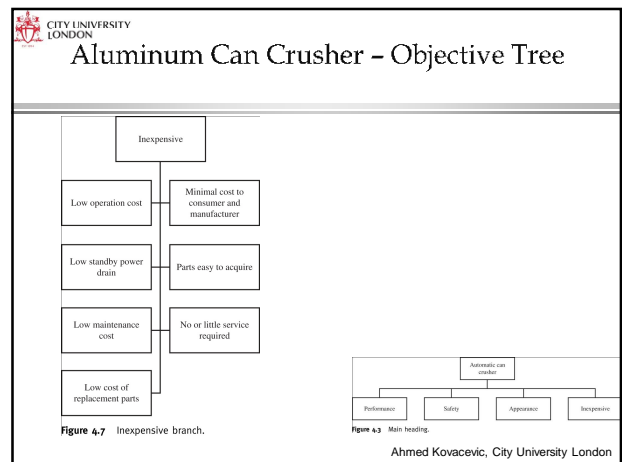

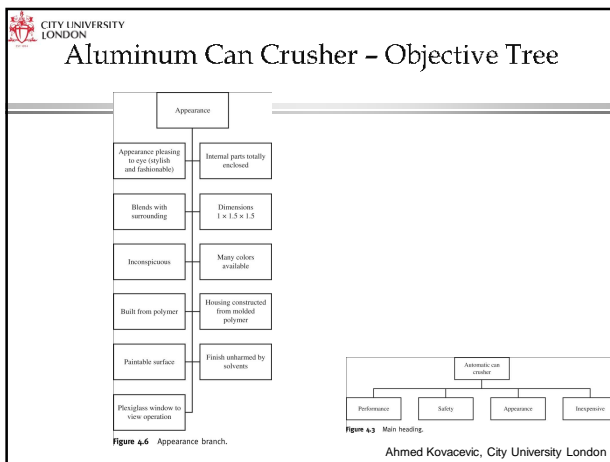

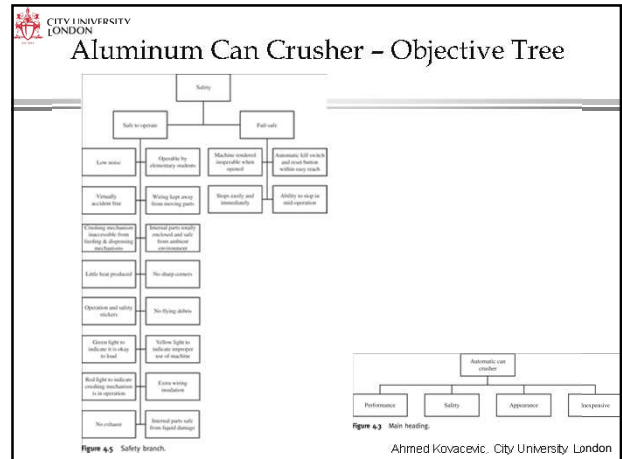

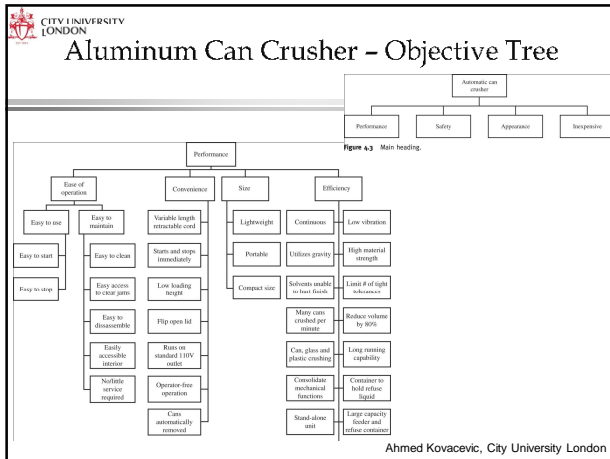

Requirements

- Requirements are a 'wish list' that the product needs to do.
- This is usually given by the customers or sponsors or even as a list of requirements in the designer's mind
- They are not usually technical
- E.g. for a coffee cup ... 'something that will hold coffee' etc..

TABLE 4.2 Aluminum Can Crusher Requirements

List of requirements in no particular order				
Pleasing to eye (stylish and fashionable)	W	5	Stand-alone unit	D 10
Internal parts totally enclosed: safe from ambient environment	D	10	Large capacity feeder and refuse container	W 4
Blends with surrounding	W	5	Cans automatically removed	D 10
Dimensions 1 x 1.5 x 1.5	D	10	Low peripheral force	W 8
Inconspicuous	W	5	Easy to start	W 9
Many colors available	W	1	Shock absorption	W 8
Built from polymer	W	2	Easy cleaning	W
Housing constructed from molded polymer	W	2	Durable refuse container	W
Paintable surface	W	3	Can counter	W
Ability to reset after kill switch has been used	W	9	Receiving containers on casters	W
Plexiglass window to view operation	W	1	Sealed bearings	W
Low noise	W	7	Ability to mount to various surfaces	D 10
Machine rendered inoperable when opened	W	10	Compact size	D 10
Operable by elementary students	D	10	Ability to crush various sizes of containers	W 3
Total Cost < \$200	D	10	Operator-free operation	W 6
Automatic kill switch and reset button within easy reach	W	10	Enough force to crush cans	D 10
Wiring kept away from moving parts	D	10	Starts immediately	W
Crushing mechanism inaccessible from feeder & dispenser	W	10	High efficiency engine	W
Yellow light to indicate improper use of machine	W	3	Light weight	W
Internal parts safe from liquid damage	W	8	Low loading height	W
Stops easily and immediately	W	9	Flip open lid	W
Little heat produced	W	6	Solvents unable to hurt finish	W
No sharp corners	W	8	Limit # of light tolerances	W

Excerpt – See book for full table

The Objectives Tree Method

- The objectives tree method is an approach to transform vague design statements into more specific customer requirements
- Make vague statements more specific by asking:
 - What is meant by that statement?
- Other useful questions to ask when expanding and clarifying design objectives:
 - Why? How? What?

Ahmed Kovacevic, City University London

The Objectives Tree Method (1)

- Three step procedure:
 - Prepare a list of design objectives
 - Order the list into sets of **higher-level** and **lower-level** objectives
 - Draw a tree of objectives, showing hierarchical relationships and interconnections

Ahmed Kovacevic, City University London

CITY UNIVERSITY LONDON
Objectives Tree Method

Step 1: Listing the Objectives

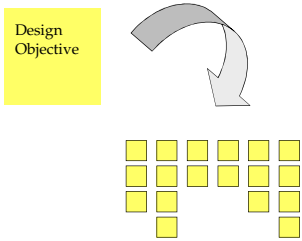

- This can be done by:
 - » Talking with (interviewing) customer
 - » Thoroughly reading any written design statements and requirements
- Take vague statements and make them clearer by asking “what is *meant* by this statement”

Ahmed Kovacevic, City University London

CITY UNIVERSITY LONDON
Objectives Tree Method

Step 2: Ordering the List

- Group the statements into related topics using an *affinity diagram*

Ahmed Kovacevic, City University London

CITY UNIVERSITY LONDON
Objectives Tree Method

Affinity Diagram

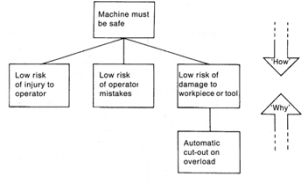

- Copy design objectives to post-it® notes
- Place one on a board
- Compare next objective card to the first
 - » If different, begin a new column
 - » If similar intent, place under the first column
- Repeat for all design objective cards
- **Result:** Objectives sorted by similar statement
 - » Within each column there may be levels of objectives
 - » Lower-level objectives answer the question “How?”
 - » Higher-level objectives answer the question “Why?”

Ahmed Kovacevic, City University London

CITY UNIVERSITY LONDON
Objectives Tree Method

Step 3: Draw the Tree

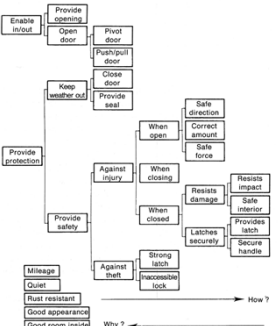

- The Objectives Tree diagram looks like an “upside-down” tree
 - » The overall objective of the tree is at the top
 - » Underneath it, branches break the objective into more detailed objectives
 - » Can have many levels and interconnections

Ahmed Kovacevic, City University London

CITY UNIVERSITY LONDON
Objectives Tree Method

Step 3: Draw the Tree (1)

- The objectives tree diagram may alternatively be drawn on its side
- Example: Car door

Ahmed Kovacevic, City University London

CITY UNIVERSITY LONDON

Example: Bumble Ball

- As a team, generate a list of objectives for the bumble ball toy
- Complete the affinity method for ordering the objectives in class
- Draw an objectives tree for the bumble ball

Ahmed Kovacevic, City University London

Deliverables for Week 4

- » Notebook
- » Work agreement
- » Team roles
- » WBS
- » Calendar
- » Gantt Chart
- » Meeting minutes from last week
- » Objectives tree

Ahmed Kovacevic, City University London

Team meeting

Ahmed Kovacevic, City University London

Project assignment

GENERAL PROJECT DESCRIPTION

Design team is asked to design, build, and demonstrate a tennis ball serving machine that uses standard liquid CO₂ 3kg bottles as source of energy. The device must be capable of serving a regulation tennis ball from behind the service line to the opposite service court shown in Figure 1. The ball should pass over the net with as little clearance height as possible. Serves should alternate between zones C and D to that one serve lands in the quarter circle pink C and the next one in the quarter circle D. The alternation between one and the other target should be automatic.

The machine should be of a materials size but height, volume should be less than 500 x 100 x 1000 mm. It should be easy to assemble and use. The machine must be completely portable, preferably on wheels and independent of any external source of energy. If electrical power is to be used for any function of the machine it must be supplied from 12V batteries which will be provided. The machine must have ball storage capable of holding at least 10 balls. For launching a ball must be placed in the machine from the storage automatically. The operator should activate the machine for each serve by use of a button, switch, or lever to initiate the serve. The energy storage and energy conversion system will be provided to the students. The remaining parts of the machine and the machine should be built within the budget of £50 per team. Purchasing of the required materials will be arranged through the University. All required materials should be ordered not later than the end of Week 5 in Term 2.

Ahmed Kovacevic, City University London

Testing

FIGURE OF MERIT

Teams will have 6 serves to set the machines before testing. After the machine is set, no manual adjustment of the machine will be allowed during testing. Testing will consist of 5 serves alternating between two targets.

The performance of the serving machine will be computed by the following figure of merit (FOM):

$$FOM = Z \left[10 - (30 - C) + 100 \left(1.8 - \frac{(d_c + d_d)}{2} \right) + 100 - T + 20 - (25 - W) \right] + 20 - A + 20 - E + 200 - DI + 30 - OI$$

Where:

Z: Multiplier based on above net zone ball passes through

Z=1.1 for zone E, 1.0 for zone F, 0.9 for zone G, and 0.8 for zone H.

C: Cost of materials in £

d_c, d_d : Minimum distances (m) from the corner of service court to the ball landing location for best serves.

T: Total number of tries to hit landing zones C and D

W: Total weight of machine plus any stand or structure needed (kg)

A: A number ranging from 0-4 assessing the workmanship and aesthetic appeal of the machine. Aesthetics also includes the ease and reliability of operation.

E: A number ranging from 0-4 assessing the ease of set-up and use of the machine.

DI: A number ranging from 1-4 measuring the creativity and/or innovation of the design. The innovation will be evaluated for sealing, aiming, feeding and storing of balls.

OI: A number ranging from 0-4 assessing the quality of the operating instructions.

Ahmed Kovacevic, City University London

What to do

Ahmed Kovacevic, City University London

Deliverables

- Teams will provide weekly memo reports documenting their progress
 - » Group notebook and Personal logbooks
- Teams will have three design reviews, and the final presentations on dates specified in the Timetable.
 - » Project review 1 – Vision (Report and PPT Presentation)
 - » Project review 2 – Concepts (Report and PPT presentation)
 - » Project review 3 – Detailed design (Report and PPT presentation)
 - » Final report – 'Dragons den' (Prototype, Report – Marketing, business, technical, PPT presentation, poster and user manual)

Ahmed Kovacevic, City University London
